

# Tension probes: reporting cellular traction forces

Cell adhesion is the critical interaction between cells and the ECM.

- Focal adhesions occur by the clustering of integrins &
- Contraction of the corresponding actin cytoskeleton
- Cells probe the mechano-chemical environment
- ~mechano-chemical sensors
- Adhesions influence signaling in e.g. proliferation-differentiation

# Measurement of mechanical tractions exerted by cells in three-dimensional matrices

Wesley R Legant<sup>1</sup>, Jordan S Miller<sup>1</sup>, Brandon L Blakely<sup>1</sup>,  
Daniel M Cohen<sup>1</sup>, Guy M Genin<sup>2</sup> & Christopher S Chen<sup>1</sup>

**Mix:**

- *EGFP fibroblasts*
- *fluorescent microbeads*
- *PEG hydrogel with degradable protein domains*

**Summary:**

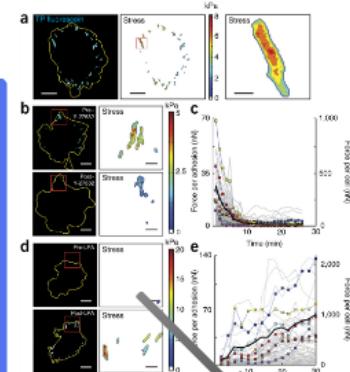

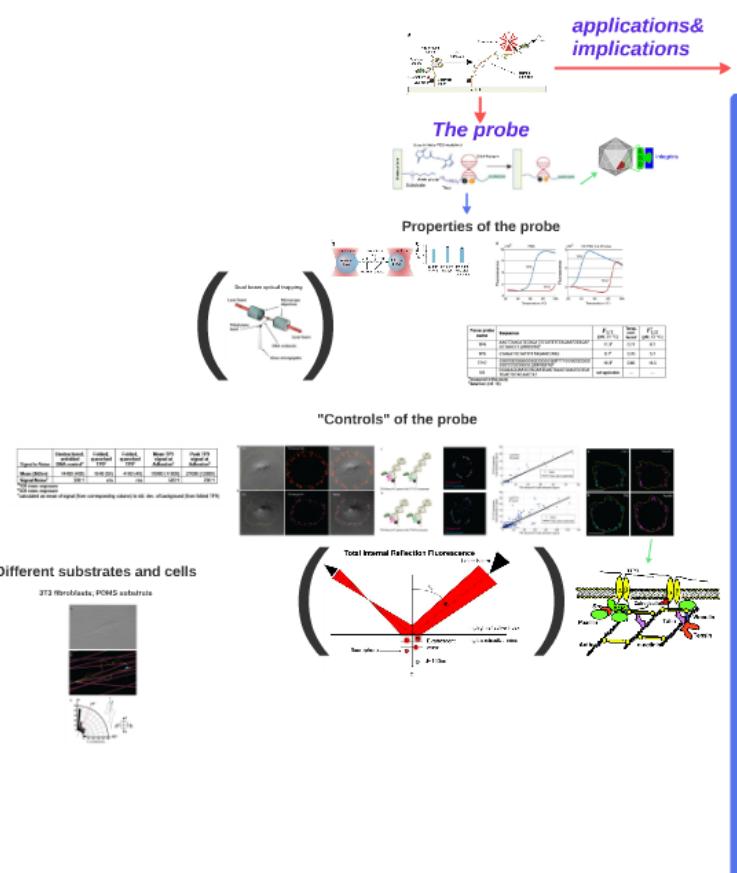

- strongest forces on the "tips"
- traction is aligned to the center of mass

**One can argue:**

- no environmental patterns
- no handles (matrix proteins)

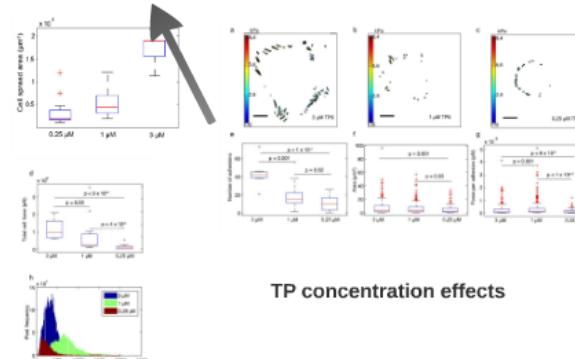

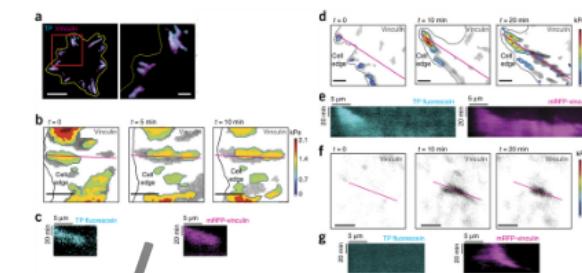

# A DNA-based molecular probe for optically reporting cellular traction forces

Brandon L Blakely<sup>1,10</sup>, Christoph E Dumelin<sup>2,10</sup>,  
 Britta Trappmann<sup>3,4,10</sup>, Lynn M McGregor<sup>5,6</sup>,  
 Colin K Choi<sup>3,4</sup>, Peter C Anthony<sup>7</sup>, Van K Duesterberg<sup>7</sup>,  
 Brendon M Baker<sup>3,4</sup>, Steven M Block<sup>8,9</sup>, David R Liu<sup>5,6</sup> &  
 Christopher S Chen<sup>1,3,4</sup>

**Results:**

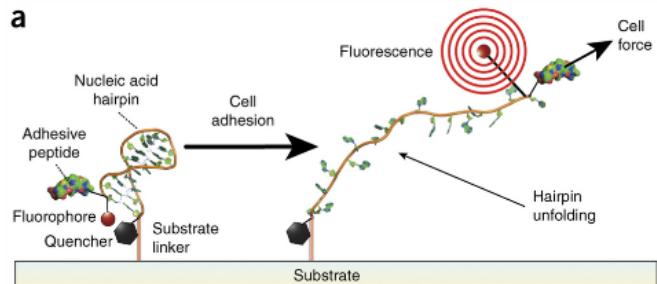

- pharmacological effects detectable
- 3 patterns of adhesion-cytoskeleton motility
- # of TP adhesions have linear&non-linear effects

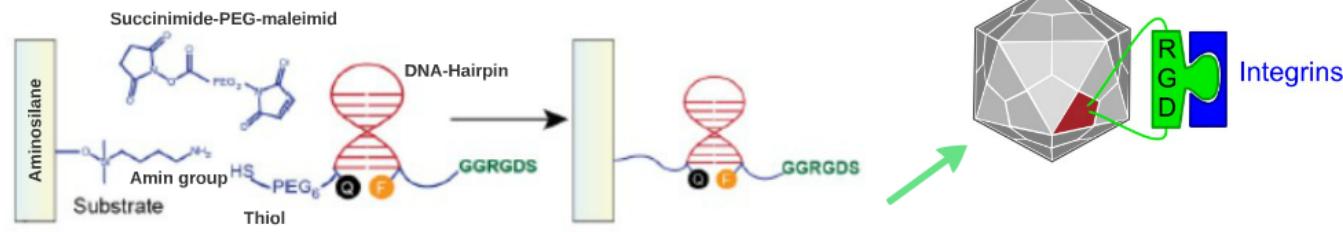

## Summary:

- 200 nm versus previous several μm resolution
- single adhesions visible
- adjustable to diff. adhesion forces
- no tough bioinformatics
- no directionality

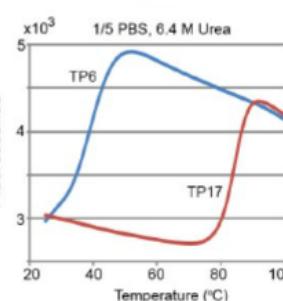

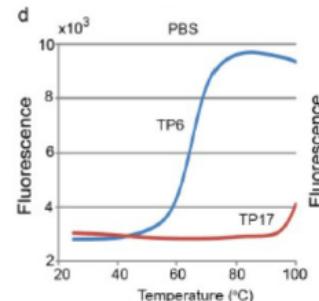

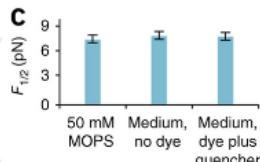

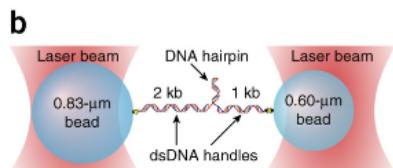

# applications & implications

## The probe

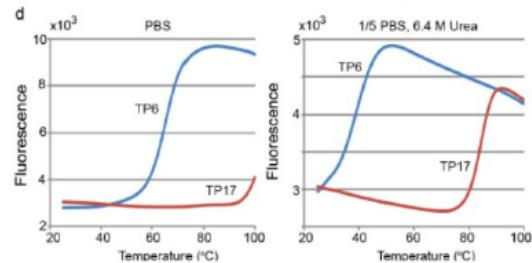

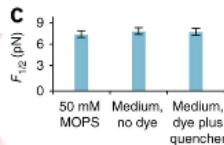

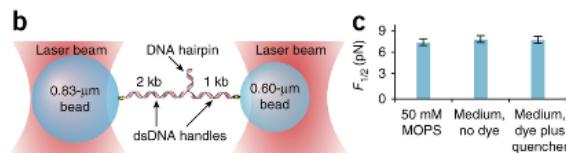

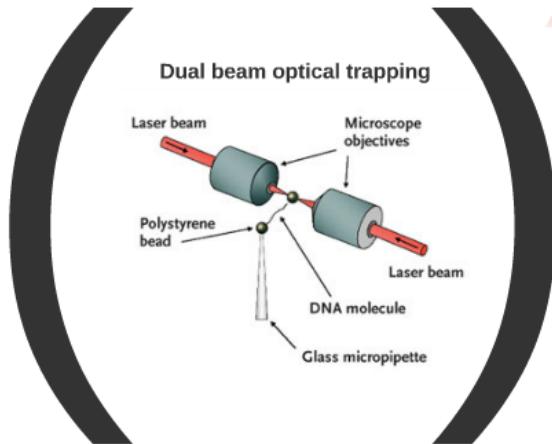

## Properties of the probe

Force probe name	Sequence	$F_{1/2}$ (pN; 21 °C)	Temp. corr. factor	$F^*_{1/2}$ (pN; 37 °C)
